Thermal detector

Bolometer

Thermal imaging

Infrared astronomy

change in voltage

$$\Delta V = N \frac{dV}{dT} \Delta T$$

N = no. of thermocouples

$\frac{dV}{dT}$: Sensitivity of each thermocouple

Thermistor

temp. coeff. of resistance.

$$\alpha = \frac{\frac{dR}{dT}}{R}$$

$$\Delta U = I R \Delta T = I \alpha \cdot R \Delta T$$

$$= \frac{V_0 R}{R + R_1} \alpha \Delta T$$

for semiconductor

$$\frac{n_e(T)}{n_e(T + \Delta T)} = e^{\left(- \frac{\Delta E_g}{k T^2} \right)}$$

Galay cell

→ use for photoacoustic

Photodiode spectroscopy

c: cell with membrane
light detection

filled with gas

1/2

$$PV = NRT$$

1/2

$$\Delta V = \frac{nR\Delta T}{p}$$

→ change in reflected position of light is change in capacitance

Pyroelectric detection

Pyroelectric

it has intrinsic dipole moment.

which changes with temp.

()

to measure →

change in surface charge

Photodetector

Wavelength (nm)

$$R \propto (10^{-24})^{1/2}$$

$$C, 10^{-24}$$

no

10/10/18

Ge: $0.6 \text{ eV} \approx 1.9 \text{ nm}$

GaAs: $1.42 \text{ eV} \approx 1.88 \text{ nm}$

PbS: $0.37 \text{ eV} \approx 3.356 \text{ nm}$

Photodiode array

length of each diode: 15 nm (L)

spacing between diodes: 10 nm (d)

1024 diodes array

length of detector: $(15 + 10) 1024$

$$= 25 \text{ mm}$$

linear dispersion for each diode

$$= \frac{dx}{d\lambda} = 5 \frac{\text{nm}}{\text{nm}}$$

Spectral Resolution: $\frac{dx}{d\lambda} \times L$

$$= 5 \times 15 \times 10^3$$

$$= 0.125 \text{ nm}$$

spectrally

$$\frac{d\gamma}{d\omega}(L+q) = .5 \times 10^{-9} \text{ m} \times 20\%$$

$$= 10^{-9}$$

=

Also called Multi-class

CCD

array MOS diode / pixels

Date - 25.02.25

PMT

series of dynodes.

$$e = \frac{Q}{V} = \frac{Ne}{V}$$
$$= \frac{Ge}{V}$$

Microchannel plate

60% holes

Source of Noise

also called dark noise.

- ① Thermal Noise \rightarrow Richardson
- ② shot noise \rightarrow discrete nature of e⁻ change.
 $I = q T^2 e^{-e\phi/kT}$
- ③ Johnson noise \rightarrow Thermal agitation of charge.
- ④ stray light \rightarrow

length of time

Natural den oscillation

oscillator model

damp oscillat.

$$\ddot{x} + \gamma \dot{x} + \omega_0^2 x = 0$$

$$x(t) = x_0 e^{-\frac{\gamma t}{2}} \cos(\omega t + \sigma)$$

$$\omega = \sqrt{\omega_0^2 - \left(\frac{\gamma}{2}\right)^2}$$

$$\gamma \ll \omega_0$$

$$x \approx x_0 e^{-\frac{\gamma t}{2}} \cos \omega_0 t$$

Superposition of oscillation of
difference frequency.

$$x(t) = \frac{1}{2\sqrt{2\pi}} \int A(\omega) e^{i\omega t} d\omega$$

$$\dot{x}(t) = \frac{1}{\sqrt{2\pi}} \int A(\omega) e^{i\omega t} d\omega$$

$$= \frac{1}{\sqrt{2\pi}} \int_0^\infty A_0 \cos(\omega t) e^{i\omega t} d\omega$$

$$A(\omega) = \frac{A_0}{\sqrt{2\pi}} \left[\frac{1}{i(\omega - \omega_0) + \frac{\gamma}{2}} + \frac{1}{(\omega + \omega_0) + \frac{\gamma}{2}} \right]$$

$$I(\omega) = A(\omega) \delta(\omega)$$

$$I(\omega) = \frac{e^{i(\omega - \omega_0)t}}{(\omega - \omega_0)^2 + (\frac{\gamma}{2})^2} \quad \text{for } \omega = \omega_0$$

$$\int I(\omega) d\omega = 1 \quad \rightarrow \frac{1}{2\pi} \frac{\gamma}{(\omega - \omega_0)^2 + (\frac{\gamma}{2})^2}$$

$$\ddot{x} + \gamma \dot{x} + \omega_0^2 x = 0$$

multiplying by m : $m \ddot{x}$

$$m \ddot{x} + \gamma m \dot{x} + m \omega_0^2 x = 0$$

$$m\ddot{x} + \frac{1}{2}m\omega_0^2 x \dot{x} = -\frac{1}{2}m\omega_0^2 x$$

$$\Rightarrow \frac{d}{dt} \left[\frac{1}{2}m\dot{x}^2 + \frac{1}{2}m\omega_0^2 x^2 \right] = -m\dot{x}^2$$

$$\Rightarrow \frac{d\omega}{dt} = -\omega \dot{x}^2$$

$$x = x_0 e^{-\gamma t} \cos \omega_0 t$$

$$\dot{x} = x_0 \left(-\frac{\gamma}{2} \right) e^{-\gamma t/2} \cos \omega_0 t$$

$$\dot{x} = x_0 \left[\cos \omega_0 t (-\gamma) e^{-\gamma t} + \omega_0 e^{-\gamma t} \sin \omega_0 t \right]$$

$$\approx x_0 e^{-\gamma t/2} \cos \omega_0 t$$

$$\gamma = \frac{1}{\tau}$$

$$\left\langle \frac{d\omega}{dt} \right\rangle = \left\langle -\omega \dot{x}^2 \right\rangle$$

$$\therefore = \left\langle -\omega \omega_0^2 x_0^2 e^{-\gamma t} \right\rangle$$
